1. Adjust your sprinklers so that they’re watering your lawn and garden, and not the street or sidewalk.

2. Water early in the morning (before 10 a.m.) or later in the evening (after 6 p.m.) when temperatures are cooler and evaporation is minimized.

3. Water established lawns about 1 inch per week (a bit more during hot, dry weather). Find out how much to water this week with the Weekly Watering Number at www.conserveh2o.org.

4. Water in several short sessions each day that you water rather than one long session to allow for better absorption and to prevent run-off.

5. Use watering gauges to time how long it takes your sprinkler system to water an inch. You can also get info on how to do this at www.conserveh2o.org (search term “gauges”).

6. Set it, but don’t forget it! Whether you have a manual or automatic system, be sure to adjust the amount you water each week throughout the irrigation season.

7. Put plants with similar watering needs in the same zone. Creating "watering zones" in your garden will allow you to give each plant the appropriate amount of water it requires.

8. Install a rain sensor. A rain sensor will allow your irrigation system to automatically shut-off if rainfall exceeds a certain amount. Afterward, the system will automatically resume its normal schedule.

9. Regularly check your irrigation system for leaks, broken lines, or blocked heads. Even small leaks can waste hundreds to thousands of gallons of water a month.

10. Add a shut-off nozzle to your garden hose and save about 5-7 gallons each minute your hose is on.
